Digital Retinal Camera

CR - 2 PLUS AF

Operation Manual

Make sure you read this manual before using the instrument. Keep this manual in a safe place so that you can use it in the future.
Thank you for purchasing the Canon Digital Retinal Camera CR-2 Plus AF (referred to as “CR-2 Plus AF” in this manual). The operation manuals for this instrument consist of the “Digital Retinal Camera CR-2 Plus AF Operation Manual” and the “Retinal imaging control software NM 2 Operation Manual.” Be sure to read these manuals thoroughly before using the instrument, and apply the information that you learn.

**Important**

- The CR-2 Plus AF must only be used by a doctor or a legally qualified person.
- The user is responsible for managing the usage and maintenance of medical equipment. We suggest that a dedicated individual is assigned responsibility for maintenance to ensure that the CR-2 Plus AF is kept in good condition and can be used safely.
- Rx Only (USA) Federal law restricts this device to sale by or on the order of a physician.

**Disclaimers**

- Canon takes no responsibility for damage that occurs due to fires, earthquakes, third-party actions, other accidents, the user's deliberate misuse, negligence, experimentation, or use under other abnormal conditions.
- Canon takes no responsibility for direct or consequential damages resulting from the use or the inability to use the CR-2 Plus AF. In addition, no compensation is available for lost image data, regardless of the cause of the loss of the image data.
- Canon takes no responsibility for injuries or property damage that may occur if safety precautions are not followed or the instrument is used for something other than its intended purpose.
- Medical examinations are the responsibility of a doctor. Canon takes no responsibility for diagnostic results.
- The user is responsible for maintaining the confidentiality of image data and must follow the laws relating to the production, processing, analysis, and storage of medical images.
- The information in this manual may be changed without prior notice.
- Although we have made every effort to ensure the accuracy of the information in this manual, if you have any questions regarding the contents, please contact your sales representative or local Canon dealer.

**Installation**

- Request your sales representative or local Canon dealer to install the CR-2 Plus AF.

**Trademarks**

- Canon and the Canon logo are trademarks of Canon Inc.
- Other system names and product names that appear in this manual are trademarks of their respective companies.

**Copyright**

- The copyright of this manual belongs to Canon Inc.
- Unauthorized reproduction, duplication, or reprinting of this manual in whole or in part is prohibited.

1 Introduction

Features

The Canon Digital Retinal Camera CR-2 Plus AF takes digital photographic retinal images of patient’s eyes across an angle of view of 45 degrees, in a naturally dilated state without using mydriatics. The CR-2 Plus AF has the following features:

**AF (Auto-focus) and AS (Auto-shot) functions**
CR-2 Plus AF is equipped with Auto-focus and Auto-shot functions. Those provide significantly improved ease-of-operation.

**A wide range of ISO speed settings**
The CR-2 Plus AF can take color images at a wide range of ISO speed settings from ISO 200 up to ISO 1600 as the standard flash intensity.
In photography at ISO 3200/6400, applying low flash intensity mode can reduce patient discomfort caused by light glare.

**Compact, user-friendly design**
The CR-2 Plus AF is designed to be small, lightweight, and compact. This makes it easier to assist patients.
An operation lever has the integrated functions: vertical movement of the main unit, switching between anterior segment and fundus, and manual focusing. This lever significantly improves alignment operability.

**Fundus Autofluorescence Photography**
(FAF) photography can be performed in non-mydriatic.

**Special digital camera**
The CR-2 Plus AF is equipped with a special digital camera using EOS digital technology. The enhanced Canon technology enables the CR-2 Plus AF to fully maximize its capabilities for shooting high-quality, high-resolution diagnostic images.

**Small pupil photography function**
The CR-2 Plus AF captures retinal images through pupils of the normal diameters from 4.0 mm. This small pupil photography function permits image to be captured through pupils from 3.3 mm in diameters.

**System optimized for digital photography**
With the supplied imaging control software, the photographed images can be browsed, processed, stored, output to the DICOM storage server, exported in DICOM or JPEG format and sent to a printer.
In this manual, the operation procedure is described with the Retinal imaging control software NM 2 (referred to as “Rics NM 2”).

Indications for Use

For USA
The CR-2 Plus AF is intended to be used for taking digital images of the retina of the human eye without a mydriatic. The CR-2 Plus AF has the following photography modes: color, red free and cobalt digital filter, and fundus autofluorescence (FAF).

For European Union
This medical device is intended to observe and record images of retinal fundus through the pupil without making contact with subject’s eye for the purpose of diagnosis by way of producing fundus image information.

- **Operation Manual for the CR-2 Plus AF**—this document
  Describes the handling precautions and operating instructions for the CR-2 Plus AF.

- **CD-ROM**—the Retinal imaging control software NM 2
  Contains the Retinal imaging control software NM 2 (Rics NM 2), which is used to record, view and store photographed images taken with the CR-2 Plus AF.

- **Operation Manual for the Retinal imaging control software NM 2**
  Describes the procedures for operating the Rics NM 2.

- **DICOM Conformance Statement**
  DICOM Conformance Statement for the Rics NM 2.

- **Software License Agreement**
  License agreement for the Rics NM 2.

- **Warranty Card** (for USA model only)

- **WEEE Directive Leaflet** (for EU model only)

- **Installation Report**

### Optional products
- External eye fixation lamp unit EL-1
- Chin rest paper—500 sheets
### Symbols to indicate safety precautions

This manual uses the following symbols to indicate precautions that are important for using the CR-2 Plus AF safely. Always follow these precautions.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="WARNING" /></td>
<td>A warning that incorrect operation may result in death or serious injury.</td>
</tr>
<tr>
<td><img src="image" alt="CAUTION" /></td>
<td>A caution that incorrect operation may result in serious injury.</td>
</tr>
<tr>
<td><img src="image" alt="CAUTION" /></td>
<td>A caution that incorrect operation may break the CR-2 Plus AF or damage other devices.</td>
</tr>
<tr>
<td><img src="image" alt="Prohibited" /></td>
<td>This symbol indicates actions that must not be taken (prohibited actions).</td>
</tr>
<tr>
<td><img src="image" alt="Required" /></td>
<td>This symbol indicates actions that must be taken.</td>
</tr>
<tr>
<td><img src="image" alt="Advice" /></td>
<td>This symbol indicates important advice that we strongly recommend be followed while operating the CR-2 Plus AF.</td>
</tr>
<tr>
<td><img src="image" alt="Supplementary" /></td>
<td>This symbol indicates supplementary explanations or advice for operating the CR-2 Plus AF.</td>
</tr>
</tbody>
</table>

### References

This manual uses the following style to indicate reference destination.

Example: (see page 15)
The following sections list the classifications applicable to the CR-2 Plus AF and the directives and standards that the CR-2 Plus AF complies with.

### Device Classification

**Protection against electric shock**
- Class I equipment

**Degree of protection against electric shock**
- Type B applied parts (Chin rest and forehead rest)

**Degree of protection against ingress of water**
- IPX0

**Degree of safety of application in the presence of a flammable anaesthetic mixture with air or with oxygen or nitrous oxide**
- Not suitable

**Mode of operation**
- Continuous operation

### Directives and Standards

**USA and Canada**

Safety Precautions

To prevent injuries and data loss, operate the CR-2 Plus AF correctly by following the safety precautions.

⚠️ WARNING

To avoid the risk of electric shock, this equipment must only be connected to a supply mains with protective earth.

🚫 Prohibited

Do not damage the power cord.
- Do not place anything heavy onto the power cord.
- Do not damage or modify the power cord.
- Do not forcibly bend, twist or pull the power cord.
- Do not hold the power cord when removing it from the AC outlet. Be sure to hold the plug.
- Do not use an extension cable with the power cord. Connect the power cord directly into the AC outlet.

Handle the power cord carefully. If the cord is damaged, contact your sales representative or local Canon dealer. A damaged cord may result in fire or electric shock.

🚫 Prohibited

Do not use a multiple socket outlet and an extension cable.
Connect the power cord directly into the AC outlet. Do not use a multiple socket outlet and an extension cable with it.

🚫 Prohibited

Do not disassemble or modify.
A disassembled or modified instrument may result in fire or electric shock. Because the CR-2 Plus AF incorporates high-voltage parts that may cause electric shocks, touching them may cause death or serious injury.

🚫 Prohibited

Do not leave alcohol, thinner, or any flammable chemicals near the instrument.
Do not place the CR-2 Plus AF near a flammable solvent. Fire may result if the solvent spills or evaporates and makes contact with the internal electric parts. Some disinfectants are flammable. Be sure to take precautions when using them.

⚠️ Stop using immediately if there is an abnormality or problem.
If an abnormality occurs, immediately turn off the power and disconnect the plugs on all devices.
- Smoke is emitted
- An unusual smell
- An unusual noise
- Foreign matter gets inside
- Devices are damaged.

Fire or electric shock may result if you continue using in such condition. Immediately turn off the power of CR-2 Plus AF, unplug the power plug and turn off the power of all connected devices. Then, contact your sales representative or local Canon dealer immediately.

🚫 Prohibited

Do not place anything on top of the device.
Fire or electric shock may result if water or any other liquid or a needle, paper clip or any foreign matter gets inside the CR-2 Plus AF.
<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Do not use a power supply voltage other than that specified on the rating label.</strong></td>
</tr>
<tr>
<td><strong>Do not use any power cord other than the one supplied.</strong></td>
</tr>
<tr>
<td>Use the power voltage specified on the rating label. Otherwise, fire or electric shock may result.</td>
</tr>
<tr>
<td>The supplied power cord is designed exclusively for this product. Do not use any other power cord.</td>
</tr>
</tbody>
</table>

| Prohibited |
| Do not plug or unplug the power plug with wet hands. |
| Do not plug or unplug the power plug or handle any other parts with wet hands. |
| Otherwise, fire or electric shock may result. |

| ! |
| Unplug the plug periodically and remove any dust or dirt around the plug and the AC outlet. |
| If the cord is kept plugged in for a long time in a dusty, humid or sooty environment, dust around the plug will attract moisture, resulting in possible insulation failure that may result in a fire. |

| ! |
| Insert the power plug completely. |
| Insert the power plug completely into the AC outlet. If a pin of the power plug makes contact with metal or any conductive object, fire or electric shock may result. |

| Prohibited |
| Do not clean the CR-2 Plus AF with flammable solvent. |
| For safety reasons, before cleaning the CR-2 Plus AF, be sure to turn off the power of all the devices and unplug the power cord from the AC outlet. Do not use alcohol, benzine, thinner or any other flammable solvent. |
| Otherwise, fire or electric shock may result. |

| ! |
| Turn off the power before inspection. |
| For safety reasons, before inspecting the instrument or cables, be sure to turn off the power of all the devices. |
| Otherwise, electric shock may result. |

| Prohibited |
| Do not play the supplied CD-ROM in any CD player that does not support data CD-ROMs. |
| Playing the CD-ROM in an audio CD player may damage the speaker. Playing the CD-ROM in an audio CD player may also cause hearing loss if listened to with headphones. |

| ! |
| Be sure to turn off the power before moving the CR-2 Plus AF. |
| Before moving the CR-2 Plus AF, make sure that the power is turned off, the power plug is removed from the AC outlet, and any cables that are connected to other devices are disconnected. |

| Prohibited |
| Do not touch conductive parts of non-medical equipment and the patient simultaneously. |
| Otherwise, electric shock may result. |

| ! |
| Use an isolation transformer when this system is connected to a network. |
| Connect an isolation transformer conforming to IEC 60601-1 for networks between the computer and HUB. |
| Otherwise, there is a risk of electric shock if the network is faulty. |
CAUTION

Do not install in locations exposed to water, steam, moisture or dust.
Doing so may cause problems or malfunctions.

Do not install in locations exposed to salt, sulfur or corrosive gas.
Doing so may result in corrosion of the instrument, problems or malfunctions.

Do not install in locations that are unstable or exposed to vibration.
The vibration may knock over the instrument or the instrument may become unbalanced and fall, resulting in a malfunction or injury.

Do not place anything near the power plug.
To make it easy to unplug the power plug at any time, avoid putting any obstructions near the AC outlet.
Fire or electric shock may result if the power plug is not unplugged during an emergency.

Do not block the vent holes.
Doing so may cause the internal temperature to rise and result in fire.

Do not place your hands or fingers on the base.
Your hand or fingers may be pinched and injured when the stage moves to either side.
Similarly, instruct the patient not to place his/her hands or fingers on the base.

Do not hold the head rest or digital camera when moving the CR-2 Plus AF.
When carrying the CR-2 Plus AF, be sure to tighten the stage lock, hold the carrying indentations at the front and rear of the base panel, and keep the CR-2 Plus AF level. Do not hold it by the digital camera or the head rest or any other parts, as they may come off and result in injury.

Hold the CR-2 Plus AF when connecting or disconnecting a cable.
For safety reasons, when connecting or disconnecting the power cord or any cable, be sure to hold the main unit. Otherwise, the main unit may fall over, possibly causing injury.

Ensure that the entire system conforms to IEC 60601-1-1.
Use the computer, monitor, and other equipment that conform to the system standard IEC 60601-1 or IEC 60950-1 for the Digital Retinal Camera CR-2 Plus AF. Be sure that the entire system conforms to IEC 60601-1-1. Be sure to also use an isolation transformer conforming to IEC 60601-1 when a computer or monitor conforming to IEC 60950-1 is used. Otherwise, electric shock may occur. For details, please contact your sales representative or local Canon dealer.
### 2 Safety

<table>
<thead>
<tr>
<th>CAUTION</th>
<th></th>
</tr>
</thead>
</table>
| **Keep the forehead rest and chin rest clean.**  
To prevent the risk of infection, wipe the forehead rest with an ethanol solution for each patient. To ensure cleanliness, replace the chin rest paper for each patient.  
If the chin rest paper is not being used, be sure to disinfect the chin rest for each patient.  
For details on how to disinfect, consult a specialist. The forehead rest may be corroded if a disinfectant other than those above is used. | |
| **Slowly move the main unit towards the patient’s eye when taking an image.**  
When adjusting the position of the main unit in the front-back direction, slowly bring the main unit closer to the patient while looking at the patient’s eye from the side.  
The patient’s eye may be injured if the objective lens makes contact with it. | |
| **Check the image before using the CR-2 Plus AF.**  
Before using the CR-2 Plus AF, be sure to take a test image to ensure that there is no foreign matter present that can affect image readings or diagnosis. | |
| **Be sure to turn off the power when not in use.**  
For safety reasons, be sure to turn off the power of all the devices when the CR-2 Plus AF is not being used.  
Also, remove the power plug from the AC outlet and put on the cover when the CR-2 Plus AF is not going to be used for a long time.  
Otherwise, dust or any foreign matter may accumulate and result in fire. | |
| **Do not touch the main unit or the chin rest while they are moving.**  
The main unit and the chin rest move to the center position when the CR-2 Plus AF main unit is turned on or a study is finished with the control software. Do not touch the main unit or the chin rest while they are moving. Keep the patient’s chin away from the chin rest. | |
| **Before packing the CR-2 Plus AF, return the main unit and chin rest to their initial positions.**  
Lower the main unit and chin rest to the bottom. To automatically lower them, turn on the power while holding down the set button. | |
| **Inspect daily and periodically.**  
For safety reasons, before using the CR-2 Plus AF, be sure to perform the daily inspection.  
Have a periodically inspection performed for the CR-2 Plus AF at least once a year by a Canon designated representative to maintain its performance and reliability. | |
| **Do not turn off the CR-2 Plus AF or the computer during image capture, data transfer, or backup.**  
Doing so might damage the computer or corrupt the data. | |
| **Do not disconnect the cable between the CR-2 Plus AF and the computer during image capture or data transfer.**  
Doing so might damage the computer or corrupt the data. | |
Notes on Using CR-2 Plus AF

Digital camera

- The attached digital camera is designed for the CR-2 Plus AF. The specifications differ from commercially available Canon digital cameras. Use only for observing and taking photographs of peoples’ eyes. Do not detach the digital camera from the main unit to use separately. Otherwise, failure of the CR-2 Plus AF may result.
- If any problems occur or repairs are needed with the CR-2 Plus AF’s digital camera, contact your sales representative or local Canon dealer.

Before use

- Inspect the CR-2 Plus AF daily. Make sure that no foreign matter is present that can affect image readings or diagnoses.
- Check and clean the objective lens before taking an image. Any stains or scratches on the objective lens will appear as white spots.
- Sudden heating of a room during winter or in cold regions may cause condensation to form on the objective lens or on optical parts inside the CR-2 Plus AF. In this case, wait until condensation disappears before taking images.
- Do not touch the lens of the retinal camera or the mirror of the digital camera when attaching and detaching the digital camera from the retinal camera. If any dirt, fingerprints, dust, or other foreign objects are on the lens or mirror, you will not be able to take a good image.

After use

- After using the CR-2 Plus AF, turn off the power, cover the objective lens with the objective lens cover to protect it from dust, and place the dust cover over the CR-2 Plus AF. You cannot take good images if the objective lens is dusty.
- If the digital camera is detached and left unattached, dirt and dust may enter the retinal camera and the digital camera. Be sure to always attach the caps to their respective mounts.

Cleaning and disinfection

- Do not allow the blower to touch the lens.
- Do not wipe or rub the lens if there is dirt or dust on it. Doing so could scratch the lens.
- Do not wipe the lens with an ethanol solution, eyeglass cleaner, or silicone-coated paper. Doing so could corrode the surface of the lens or leave streaks.
- Do not clean the outside of the CR-2 Plus AF with a lens cleaner. Doing so could damage the outside of the CR-2 Plus AF.
- Never use alcohol, benzine, thinner, or other solvents to clean the outside of the CR-2 Plus AF. Doing so damages the outside of the CR-2 Plus AF.
- Never use an ethanol solution to clean the outside of the CR-2 Plus AF, with the except of the forehead rest and the chin rest. Doing so damages the outside of the CR-2 Plus AF.
- If the chin rest paper is not being used, disinfect the chin rest for each patient in the same manner as you do for the forehead rest.
- Carry out all cleaning, sterilization and disinfection procedures specified in the instruction manual for each peripheral device in the system.
Environment of use

- Use, store, and transport the CR-2 Plus AF in an environment that is within the range of the following conditions. Use the original packaging to store or ship it.

<table>
<thead>
<tr>
<th>Environment of use</th>
<th>Temperature</th>
<th>Humidity</th>
<th>Atmospheric pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment of use</td>
<td>10 to 35°C</td>
<td>30 to 90% RH (no condensation)</td>
<td>600 to 1060 hPa</td>
</tr>
<tr>
<td>Storage and transportation environment</td>
<td>–30 to 50°C</td>
<td>10 to 95% RH (no condensation)</td>
<td>600 to 1060 hPa</td>
</tr>
</tbody>
</table>

- Do not install, store, or leave the CR-2 Plus AF in a very hot or humid environment. Also, do not use the CR-2 Plus AF outside. Doing so may cause a malfunction or misoperation.
- Always try to keep the room as clean as possible. After many years of usage, airborne dust in the room may get on the objective lens as well as the optical parts in the main unit. You cannot take good images if dust is on the equipment.
- When the CR-2 Plus AF is not being used, attach the objective lens cap and place the dust cover over the CR-2 Plus AF.

Installation

- Request your sales representative or local Canon dealer to install the CR-2 Plus AF.
- A strong shock to the CR-2 Plus AF may put it out of alignment. Please handle the unit carefully.

Transportation

- Lower the main unit and chin rest to the bottom. To automatically lower them, turn on the power while holding down the set button.
- Be sure to turn off the CR-2 Plus AF’s power switch, remove the AC plug from the outlet, and disconnect any cables connected to other equipment.
- When lifting the main unit, do not hold the head rest or digital camera. Hold the main unit by the indentations for lifting at its front and rear, and keep it level.
- When transporting the CR-2 Plus AF, align the stage with the base, and then lock the stage with the stage lock lever.
- The CR-2 Plus AF needs to be protected from vibration and shocks when it is transported in a vehicle or over long distances. For details, contact your representative or local Canon dealer.
Disposal

Disposal of this product in an unlawful manner may have a negative impact on human health and on the environment. Therefore, when disposing of this product, be absolutely certain to follow the procedure which conforms with the laws and regulations applicable to your area.

European Union (and EEA*) only

This symbol indicates that this product is not to be disposed of with your household waste, according to the WEEE Directive (2002/96/EC) and your national law. This product should be handed over to a designated collection point, e.g., on an authorized one-for-one basis when you buy a new similar product or to an authorized collection site for recycling waste electrical and electronic equipment (EEE). Improper handling of this type of waste could have a possible negative impact on the environment and human health due to potentially hazardous substances that are generally associated with EEE. At the same time, your cooperation in the correct disposal of this product will contribute to the effective usage of natural resources. For more information about where you can drop off your waste equipment for recycling, please contact your local city office, waste authority, approved WEEE scheme or your household waste disposal service. For more information regarding return and recycling of WEEE products, please visit www.canon-europe.com/WEEE.

* EEA: Norway, Iceland and Liechtenstein
The following symbols are associated with the CR-2 Plus AF.

- Alternating current
- Type B
- Symbol for “Consult instructions for use”.
- Caution: Check the documentation provided.
- Class I device indicating manufacturer’s declaration of conformance with the Annex VII of the Medical Device Directive, 93/42/EEC
- Certification mark that indicates the product complies with US and Canadian medical electrical system safety requirements.

3 Names of Parts

Retinal Camera

1 Digital camera
2 Power switch for the digital camera
3 Digital camera cover
4 Observation monitor
   For viewing the anterior segment and the fundus.
5 Operation lever
6 Shutter release button
   1st step: Relaunching Auto fundus observation and AF
   2nd step: Taking the image
7 Alignment button
   Switches between a view of the anterior segment and the fundus.
8 Main unit vertical movement ring
   Turn right: Main unit moves up.
   Turn left: Main unit moves down.
9 Focus ring
   Turn to focus the image.
10 Stage lock
11 Indentation for lifting
12 Height adjustment mark
13 Main unit
14 Operation panel
15 USB connector
16 AC power connector
17 Power switch for main unit
18 Stage
19 Connector for external eye fixation lamp (with cap)  26 Base
Connector for the external eye fixation lamp (sold separately).
20 Forehead rest
21 Objective lens
22 Objective lens cap
23 Head rest
24 Chin rest
25 Indentation for lifting
3 Names of Parts

Operation Panel

1 Flash intensity button/lamp
   +: Flash intensity increases.
   –: Flash intensity decreases.

2 Observation light brightness button/lamp
   +: Observation light brightness increases.
   –: Observation light brightness decreases.

3 x2 photography button/lamp
   Enables x2 photography function. (See 32)

4 Small pupil photography button/lamp
   Enables small pupil photography function. (See page 33)

5 CHIN REST button
   Top: Raises chin rest.
   Bottom: Lowers chin rest.

6 Photography mode button
   Switches between COLOR and FAF photography.

7 Photography mode lamp

8 FIX TARGET/MENU Button
   Move up, down, right, and left to move internal eye fixation lamp (in fundus observation) / to move MENU sections.

9 Set button/lamp
   Internal eye fixation lamp blinks (in fundus observation) / to select NEMU sections.

10 POWER lamp
   Lights when power is turned on.

11 Anterior segment photography button/lamp
   Switches to anterior segment photography.
Observation Monitor

During anterior segment observation (with x1.3 magnification)

1 Auto fundus observation indicator
2 Photography mode indicator
   COLOR: Color photography mode
   FAF: Fundus autofluorescence photography mode
3 Pupil alignment circles
4 Observation light brightness indicator
5 Photography ready lamp
   Green: Ready to shoot
   Red: Not ready to shoot
6 Left/right eye indicator
   R: Right eye
   L: Left eye
7 Anterior segment photography indicator
8 Flash intensity indicator

During fundus observation (with x1.3 magnification)

1 Indicator for top limit of position of main unit
   Appears when main unit has reached top limit.
2 Focus indicator
3 Continuous photography indicator
   Fundus observation does not return to anterior segment after photography.
4 AS (Auto-shot) guide (green)
5 Internal eye fixation lamp position indicator
6 x2 photography indicator
7 Small pupil photography indicator
8 AF (Auto-focus) indicator
9 AS (Auto-shot) indicator
10 Diopter compensation position indicator
   None: No diopter compensation
   +: Positive compensation
   -: Negative compensation
11 Small pupil photography range
12 x2 photography range
13 Indicator for bottom limit of position of main unit
   Appears when main unit has reached bottom limit.
The flow of operation for retinal photography is as follows. Connect the cables if necessary as described in “Connecting Cables” (see page 23).

1. Preparing for an Examination (page 23)
2. Patient Setup (page 25)
3. Alignment and Photography (page 25)
4. Manual Focus Photography (page 31)
5. x2 Photography (page 32)
6. Small Pupil Photography Function (page 33)
7. Diopter Compensation (page 34)
8. FAF (Fundus Autofluorescence) Photography (page 34)
9. Anterior Segment Photography (page 35)
10. Finishing an Examination (page 30)
4 Basic Operations

Connecting Cables

Connect the CR-2 Plus AF to a computer in which the supplied software, Rics NM 2 has been installed.

**WARNING**

- Do not plug or unplug the power plug with wet hands.
- Do not use any power cord other than the one supplied.

Otherwise, fire or electric shock may result.

1. Make sure that the power switch for the CR-2 Plus AF is turned off.

2. Connect the power cord and the USB cable to the retinal camera.

3. Insert the power plug all the way into an AC outlet.

4. Connect the other end of the USB cable to the computer’s USB port.

   ![Use a high-speed AB type USB cable that is shorter than three meters. For details, contact your sales representative or local Canon dealer.]

Preparing for an Examination

**CAUTION**

- To prevent the risk of infection, wipe the forehead rest with an ethanol solution for each patient. For details on how to disinfect, consult a specialist.
- To ensure cleanliness, replace the chin rest paper for each patient.

1. Turn on the computer and start the Rics NM 2.

2. If the digital camera is off, turn the switch to the ON.

   ![If the Mode Dial is set to anything other than M, an image cannot be taken. While holding down the button at the center of the Mode Dial, turn the dial to M.]

3 Remove the objective lens cap and turn the retinal camera's power switch to the ON position.
The POWER lamp lights and the set lamp blinks. The CR-2 Plus AF automatically does an initialization sequence (internal check and initialization of driving parts). After the initialization the parts of the main unit stop in their center positions.

**CAUTION**
The main unit and the chin rest move to the center position when the CR-2 Plus AF is turned on. Do not touch the main unit or the chin rest while they are moving. Keep the patient’s chin away from the main unit and chin rest when they are moving.

---

**Power-saving function**
If the power is on and the buttons on the operation panel are not operated for over 10 minutes, the power-saving function is activated. The POWER lamp blinks while in power saving mode. To return to normal mode, press any button on the operation panel or move the stage right or left.

4 Press and hold the unlock button and slide the stage lock to the UNLOCK side.
Align the mark on the stage lock and the mark on the left side of the base. The stage lock is released.

5 Move the stage towards you with the operation lever.

6 Disinfect the forehead rest and replace the chin rest paper.
If chin rest paper is not being used, disinfect the chin rest also.

**CAUTION**
- To prevent the risk of infection, wipe the forehead rest with an ethanol solution for each patient. For details on how to disinfect, consult a specialist.
- To ensure cleanliness, replace the chin rest paper for each patient.
Patient Setup

1 Start an examination on the Rics NM 2.
   Enter the patient’s information.
   The set lamp lights and the observation monitor turns on.

2 Seat and position the patient.
   • Instruct the patient to remove his/her contact lenses or glasses, if he/she is wearing them.
   • Have the patient place his/her chin on the chin rest and his/her forehead against the forehead rest.
     Adjust the heights of the optical bench and chair so the patient is comfortable.

3 Move the chin rest with the CHIN REST button so that the patient’s eye is aligned with the height adjustment mark.

4 Move the stage toward the eye to be photographed.

   CAUTION
   • Do not place your hands or fingers on the base.
   • Instruct the patient not to place his/her hands or fingers on the base.
   Otherwise, your or the patient’s hands or fingers may be pinched, possibly resulting in injury.

   Hold the operation lever, pull it toward you, and then move the stage.

Alignment and Photography

This section describes the standard procedures for taking images using Auto-fundus observation, AF (Auto-focus), and AS (Auto-shot) functions.

1 Align the retinal camera with the eye to be photographed.

   CAUTION
   When adjusting the position of the retinal camera in the front-back direction, slowly bring the main unit closer to the patient while looking at the patient’s eye from the side. The patient’s eye may be injured if the objective lens makes contact with it.
1. Move the stage until the eye to be photographed appears on the observation monitor.
2. Adjust the center of the patient’s pupil and the pupil alignment circles.
3. Have the patient stare at the green blinking internal eye fixation lamp.

During examination of the anterior segment of a patient who is extremely near- or far-sighted, the patient may not be able to see the internal eye fixation lamp.

- To move the main unit slightly to the left or right, tilt the operation lever to the left or right.
- To move the main unit slightly to the front or back, tilt the operation lever to the front or back.
- To move the main unit up or down, turn the main unit vertical movement ring.

When the vertical position cannot be fully adjusted by using the operation lever
Adjust the height of the chin rest with the CHIN REST button to raise or lower the patient’s face.

2 Tilt the operation lever forward or backward to unify the top and bottom of the image of the pupil.
When the top and the bottom of the image of the pupil are unified, the anterior segment automatically switches to the fundus on the observation monitor.

**Auto-fundus Observation Indicator**

Displayed when Auto-fundus observation function is available. Icon colors indicate the status of the detecting pupil.

- Total color of icon is dark gray: Error in the detecting pupil.
- Indication bar is totally dark gray: The detecting pupil is impossible.
- The left side of indication bar is green: The position of the detecting pupil is not effective.
- Indication bar is totally green: The position of the detecting pupil is effective.

When the pupil is smaller than the inner pupil alignment circle, images cannot be taken properly.

Darken the room further to dilate the patient’s pupil more. If the patient's pupil does not dilate enough, use the small pupil photography function (see page 33).

**Adjustment of observation light brightness**

Adjust the observation light brightness with the observation light brightness button.

**Guidelines for observation light brightness**

Adjust to the lowest possible brightness level to reduce the strain on the patient's eye.

**Observation monitor brightness adjustment**

Use the Rics NM 2 to adjust the brightness of the observation monitor. See the Rics NM 2 manual for details.
3 Have the patient stare at the internal eye fixation lamp to fix the part for the photograph. Take the following steps to guide the patient’s eye: Press the FIX TARGET buttons up, down, left, and right to move the internal eye fixation lamp to your desired position and then press the set button to make it blink. If the eye cannot be guided by the internal eye fixation lamp, use the external eye fixation lamp (sold separately).

Press the set button for at least two seconds to reset the position of the internal eye fixation lamp. See the Rics NM 2 manual for details.

4 Perform a preliminary check before taking photos.
   a. The photography ready lamp lights green.
   b. The working distance dots appear.
   c. The focus indicator appears.

Photography ready lamp
   • Green: Ready to shoot.
   • Red: Preparing to shoot. Wait until the lamp lights green.

Flash intensity adjustment
The flash intensity is set in advance to the standard level. Every time the flash intensity button is pressed the flash intensity increases by 0.3 stop.

Appearance of flare
Even if the working distance dots are adjusted to be extremely clear, flare may appear around the retinal image depending on the patient’s eye.
5 Control the operation lever and take the image.

The Auto-focus function aligns split lines into a single line. Adjust the operation lever to make the working-distance dots sharp and put both dots into the Auto-shot guide square.

The flash fires and an image is taken.

**AF (Auto-focus) Indicator**
Displayed when AF (Auto-focus) function is available. Icon colors indicate AF status.
- The right side of indication bar is red: AF error
- The left side of indication bar is green: AF in operation
- Indication bar is totally green: AF completed

**AS (Auto-shot) Indicator**
Displayed when AS (Auto-shot) function is available. Icon colors indicate AS status.
- Indication bar is totally dark gray: Error in detecting WD.
- The right side of indication bar is red/orange: The position or the shape of WD is not effective.
- The left side of indication bar is green: AS is in preparation.
- Indication bar is totally green: AS is ready.

Although the AS icon indicates the preparation status, it may be possible to take an image.

Turn the focus ring to release AF and manual focus shooting can be done. AS function is not available for manual focus shooting.

If AF or AS does not work, please refer to “7 Troubleshooting” (see page 43) and follow the instructions.
6 Check the photographed image
The preview is displayed on the observation monitor.
Press the SET button to save the image. The image is saved and the preview is closed. If any
description is made on this screen, the image taken is saved automatically and the preview is closed.
If the image will be retaken, press the Retake button to activate “Retake” and press the SET button. The
preview is closed and returns to the anterior segment observation.
To take images of the other eye, repeat procedures from step 1 of Alignment and Photography (see page 25).

This preview screen is displayed in approximately 3 seconds.
Use the Rics NM2 to change display time.

Auto-fundus observation function will be temporarily unavailable after photography. To relaunch
the function, press the shutter release button halfway until a beep sounds.

If flare appears
See “7 Troubleshooting” (see page 43) and follow the instructions.

Finishing an Examination

1 End the examination on Rics NM 2.
The set lamp starts blinking and the observation monitor turns off.

CAUTION
The main unit and the chin rest move to the center position when a study is finished with the Rics
NM 2. Do not touch the main unit or chin rest while they are moving.

2 Align the stage with the base and slide the stage lock
to LOCK side to lock the stage.
Align the mark on the stage lock and the mark on the right side
of the base.

3 Turn off the power to the CR-2 Plus AF.

4 Exit the Rics NM 2 and turn off the computer.
5 Photography Auxiliary Functions

The section describes how to use manual focus photography, x2 photography, small pupil photography, diopter compensation, FAF (Fundus Autofluorescence) photography, and anterior segment photography. Instructions are also included for connecting an optional external monitor.

Manual Focus Photography

Turn the focus ring during fundus observation. Auto-focus (AF) and Auto-shot (AS) functions will be suspended and the system will switch temporarily to manual focus photography. Press the shutter release button halfway until a beep sounds: this indicates that AF and AS are available.

Shutter Release Button

The shutter release button has two steps. The first step is to press the button halfway down; the second step is to press the button all the way down.

1 Turn the focus ring to align the split lines into a single line.

The image enlarges while the focus ring is being turned.

When the split lines do not align

If the patient’s diopter range is outside the –10 to +15 D, it is not possible to focus with the focus indicator. In this case, use the diopter compensation function (see page 34), and focus the image until it is sharp.

2 Perform a preliminary check before taking photos.

a. The photography ready lamp lights green.

b. The working distance dots appear sharpest.

c. The working distance dots are inside the AS guide.

d. The split lines form a single line.
3 Press the shutter release button completely and take the image.
The flash fires and an image is taken.
The preview is displayed on the observation monitor.

**x2 Photography**

You can take and save images that are within the x2 photography range on the observation monitor.

1 Press the x2 photography button.
The lamp on the x2 photography button lights, and the x2 photography indicator and x2 photography range marks appear on the observation monitor.

2 Perform alignment and photography in the same manner as for basic operations.
x2 photography can be performed in the same manner as for color photography (see page 25). The image in the x2 photography range appears on the Rics NM 2 screen.
Small Pupil Photography Function

If the patient’s pupil does not dilate enough, use the small pupil photography function. When the function is used, pupil diameters 3.3 mm or larger can be photographed.

1 Press the small pupil photography button.
The lamp on the small pupil photography button lights, and the small pupil photography indicator and a dotted circle appear on the observation monitor.

2 Perform alignment and photography in the same manner as for basic operations.
Small pupil photography can be performed in the same manner as for color photography (see page 25). Press the small pupil photography button again to finish the small pupil photography.

---

- When Auto-fundus observation does not work, tilt the operation lever forward or backward to unify the top and bottom of the image of the pupil. Then press the alignment button. The retina appears on the observation monitor.
- When the split lines do not appear clearly, Auto-focus will not work. Turn the focus ring and take images using manual focus photography (see page 31).

---

- Do not use the small pupil photography function if the patient’s pupil is large enough. The image will be overexposed.
- The image may contain flare around the edges of the image outside the photography range.
5 Photography Auxiliary Functions

Diopter Compensation

Insert the diopter compensation lens into the CR-2 Plus AF and take the photograph. Note that when the diopter compensation is set to the – or + position, the focus indicator does not appear. Turn the focus ring to focus the retinal image in a position that renders the image sharp on the observation monitor.

- compensation: Turn the focus ring counterclockwise until the end of – position. Then stop and turn further; compensation lens is inserted.
- + compensation: Turn the focus ring clockwise until the end of + position. Then stop and turn further; compensation lens is inserted.
- No compensation: Turn the focus ring clockwise (counterclockwise) until the end of + (-) position. Then stop and turn further; compensation lens is released.

The CR-2 Plus AF can provide appropriate images if the diopter of the patient’s eye is within the respective ranges below.
- No compensation: –10 to +15 D
- – compensation: –31 to –7 D
- + compensation: +11 to +33 D

Note Auto-focus is not available when the diopter compensation is set to the – or + position. Take images using Manual Focus Photography (see page 31).

FAF (Fundus Autofluorescence) Photography

This function makes it possible to take fundus autofluorescence images.

1 Press the photography mode button.
The FAF mode lamp lights and the FAF mark appears on the observation monitor.

2 Perform alignment and photography in the same manner as for basic operations.
Fundus autofluorescence photography can be performed in the same manner as for color photography (see page 25).
Anterior Segment Photography

This function makes it possible to photograph the anterior segment. It is also possible to use the x2 photography function at the same time.

! Do not allow external light in the infrared spectrum to enter the position being photographed.

1 Press the anterior segment photography button.
The anterior segment photography mark appears on the observation monitor.

2 Move the operation lever to align the area to be photographed in the center of the observation monitor.

3 Tilt the operation lever to the front or back to focus on the area to be photographed.
   • Focus the image so that the area to be photographed can be seen as clearly as possible.
   • Make sure that the photography ready lamp light is green.

4 Press the shutter release button completely.
The flash fires and an image is taken.
The preview is displayed on the observation monitor.

Note: Auto-focus and Auto-shot functions are not available on this mode.

External Monitor

The image on the observation monitor can be viewed on an external monitor.
Contact your sales representative or local Canon dealer about external monitors and mini HDMI cables that can be used.

! • Before connecting or disconnecting the HDMI cable, be sure to turn off the retinal camera and all other devices.
   • Use an external monitor that conforms to IEC 60601-1 or IEC 60950-1. If you use a monitor that conforms to IEC 60950-1, be sure to also use the isolation transformer that is designated by Canon. For details, contact your sales representative or local Canon dealer.
5 Photography Auxiliary Functions

1 Remove the digital camera cover.

2 Connect the HDMI cable to the digital camera.
   1. Securely insert the HDMI cable into the mini HDMI output terminal on the digital camera.
   2. Fit the HDMI cable into the space in the cover, and place the video cable in the notch.

3 Attach the digital camera cover.
   1. Hook the digital camera cover hook onto the strap mount of the digital camera.
   2. While taking care to avoid pinching the HDMI cable, insert the cover screw to secure the digital camera cover.

4 Connect the HDMI cable to the external monitor.
   Connect the HDMI cable to the HDMI input terminal on the external monitor. Turn on the external monitor, and select the input using the monitor’s input switch.

5 Turn on the power to the external monitor and the retinal camera.
   The image is displayed on the external observation monitor. No image is displayed on the observation monitor of the retinal camera.
This section outlines the maintenance instructions for the CR-2 Plus AF: daily inspection, cleaning, disinfecting, refilling chin rest paper, and removing/installing the digital camera.

**CAUTION**
- For safety reasons, before using the CR-2 Plus AF, be sure to perform the daily inspection.
- Have the CR-2 Plus AF inspected at least once a year by a Canon designated representative to maintain its performance and reliability.

### Daily Inspections

Perform the following inspections before using the CR-2 Plus AF to ensure that it is used safely and correctly.

If a problem is found during the inspection and you are unable to correct the problem, please contact your sales representative or local Canon dealer.

#### Checks before turning on the power

Check the following items before turning on the power.

**Cables**
1) The power cord and connection cable are not damaged and their insulation is not torn.
2) The power cord is fully and securely inserted into the AC connector on the main unit and the AC outlet.

**Main unit**
1) The digital camera cover and parts are not damaged or loose.
2) The stage moves when the operation lever is tilted back and forth and right to left.
3) The digital camera is securely installed.
4) The stage lock operates properly.
5) There are no scratches or dirt on the objective lens. Clean the objective lens if it is dirty (see page 38).

#### Checks after turning on the power

Turn on the CR-2 Plus AF and start the Rics NM 2. Check the following items after starting an examination.

**Main unit**
1) The power lamp lights.
2) The observation light brightness changes as the observation light brightness button is pressed.
3) A flash is emitted.
4) The main unit moves up and down as the main unit vertical movement ring is turned.
5) The chin rest moves up and down as the CHIN REST button is pressed.

**Photographed image**
1) Foreign objects that affect the reading of the images or diagnosis do not appear in the photographed image. Place a piece of white paper in front of the objective lens and photograph an image under the following conditions:
   - Flash intensity: Standard
   - Diopter compensation: Compensation lens released
   - Focus ring: Turned clockwise more than 1 rotation.
Cleaning the Objective Lens

1. Do not wipe or rub the objective lens if there is dirt or dust on it. Doing so could scratch the surface of the lens.
2. Do not wipe the objective lens with disinfectant ethanol, eyeglass cleaner, or silicone-coated paper. Doing so could corrode the surface of the lens or leave streaks.

For information about lens cleaning paper, lens cleaner, and blowers, contact your sales representative or local Canon dealer.

If the objective lens is dirty, clean it according to the procedure below.

1. Check for any dirt.
   Illuminate the objective lens with a penlight to check for dirt.

2. Blow away any dust or dirt.
   Use a blower to blow away any dust or dirt on the lens. Do not use a brush to dust off.

   ![Warning]
   Do not allow the blower to touch the objective lens.

3. Wipe the objective lens.
   1. Slightly dampen a lens cleaning paper with lens cleaner and lightly wipe the objective lens.
   2. Starting from the center of the lens, wipe the lens in spirals toward the circumference.
   3. Change the lens cleaning paper and wipe the objective lens until the dirt is gone and there are no streaks.

   ![Warning]
   Use lens cleaning paper and lens cleaner designated by Canon.
Cleaning the Image Sensor

The digital camera has a self-cleaning sensor unit. Dirt and dust on the front surface of the imaging sensor are automatically removed when the power is turned on or off. This function makes it possible to remove the majority of dirt and dust that may interfere with images. It is not necessary to be aware of this function during normal usage.

To use the self-cleaning sensor unit for cleaning, follow the procedure below.

1. Make sure that the power switch for the retinal camera is turned off.
2. Switch the digital camera’s power switch from on to off. The self-cleaning sensor unit starts and the imaging sensor is cleaned.
3. Check that the dirt and dust have been removed.
4. Switch the digital camera’s power switch to on, photograph an image and check the image.

If the above procedure does not remove the foreign object, the cause may not be dirt or dust. Contact your sales representative or local Canon dealer.

Cleaning the Outside of the CR-2 Plus AF

**WARNING**

- Before cleaning the CR-2 Plus AF, be sure to turn off the power of all connected devices and unplug the power cord from the AC outlet.
- Do not use alcohol, benzine, thinner or any other flammable cleaning solvent. Otherwise, fire or electric shock may result.

**WARNING**

Do not clean the outside of the CR-2 Plus AF with lens cleaner. It may corrode the surface.

If the outside of the CR-2 Plus AF is dirty, wipe it twice with a soft cloth. First use a cloth that has been soaked in diluted neutral cleanser and well wrung out. Then use a cloth that has been soaked in water and well wrung out.
6 Maintenance

Disinfecting the Forehead Rest

⚠️ CAUTION
- To prevent the risk of infection, wipe the forehead rest with an ethanol solution for each patient.
- The forehead rest may be corroded if a disinfectant other than ethanol is used.
For details on how to disinfect, consult a specialist.

Use a sanitized gauze or wipe that includes disinfectant to clean the forehead rest for each patient.

Refilling Chin Rest Paper

⚠️ CAUTION
If the chin rest paper is not being used, be sure to disinfect the chin rest for each patient. For details on how to disinfect, see the Disinfecting Forehead Rest section above.

1. Pull out the right and left chin rest holding pins.
2. Insert the holding pins into the holes on the right and left of the chin rest paper.
3. Attach the chin rest paper to the chin rest with the pins pressing into the holes on the chin rest.

Chin rest paper is a consumable product (sold separately). To purchase chin rest paper, contact your sales representative or local Canon dealer.

Attaching and Removing the Digital Camera

The CR-2 Plus AF is equipped with a specialized digital camera. It is not necessary to attach or remove the digital camera during normal usage.
To replace the digital camera, follow the procedure below.

⚠️
Although not recommended, if you need to remove and attach the digital camera, take the following precautions.
- Work quickly in a location where there is little dust.
- When removing the digital camera for storage, be sure to attach the supplied camera mount cap to the retinal camera and the body cap to the digital camera.
- Wipe off any dust from the camera mount cap and the body cap before attaching them.
- Do not touch the lens in the main unit or the mirror in the digital camera. It is not possible to take good images if dirt, fingerprints, or dust are on these parts.
Removing the digital camera

1. Turn off the power to the retinal camera and remove the plug from the AC outlet.

2. Loosen the cover screw and remove the digital camera cover.

3. Remove the cables from the digital terminal and the remote control terminal.

4. Remove the DC coupler.
   1. Open the battery compartment cover on the digital camera, and then slide the battery lock lever to remove the DC coupler.
   2. Close the battery compartment cover.

5. While holding down the lens release button on the digital camera, turn the digital camera counterclockwise to remove it.

6. Attach the caps to the retinal camera and the digital camera mount.
Installing the digital camera

1 Be sure to check the following items:
   • The power to the retinal camera is off.
   • The power plug of the retinal camera is not plugged into an electric outlet.

2 Attach the digital camera to the retinal camera.
   1. Align the positions of the mounting alignment marks on the retinal camera and the digital camera.
   2. Fit the digital camera’s lens mount to the retinal camera’s mount.
   3. Turn the digital camera clockwise until it clicks.

3 Attach the DC coupler to the digital camera.
   1. Open the battery compartment cover of the digital camera, and attach the DC coupler.
   2. Pass the cord for the DC coupler through the DC coupler cord hole and then close the battery compartment cover.

4 Open the terminal cover of the digital camera and attach the cables to the digital terminal and the remote control terminal.

5 Attach the digital camera cover to the digital camera.
   1. Hook the digital camera cover hook onto the strap mount of the digital camera.
   2. Insert the cover screw to secure the digital camera cover.
If any of the symptoms listed here occurs or if a warning appears in the Rics NM 2 while using the CR-2 Plus AF, try the relevant remedy described below.

If these remedies do not eliminate the symptoms or the warning, turn off the power and contact your sales representative or local Canon dealer. Be ready to provide a detailed description of the symptoms and message.

Appendix

EMC (Electromagnetic Compatibility)

The CR-2 Plus AF is designed and tested to comply with IEC 60601-1-2 (EN 60601-1-2), the applicable regulations regarding EMC for medical devices. The CR-2 Plus AF needs to be installed and put into service according to the EMC information stated as follows.

If this equipment causes harmful interference to other devices, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving device.
- Increase the separation between the equipment.
- Connect this device into an outlet on a circuit different from that to which the other devices are connected.

If the problem cannot be solved with the above measures, stop using this equipment and consult your sales representative or local Canon dealer.

Precautions on EMC

1. Medical electrical equipment needs special precautions regarding EMC and needs to be installed and put into service according to the EMC information provided in the manual.
2. Portable and mobile RF communications equipment can affect medical electrical equipment.
3. Information regarding the cable affecting EMC is as follows.

   To maintain the optimum EMC performance, use only the designated cables.

<table>
<thead>

4. The use of accessories, transducers and cables other than those specified, with the exception of transducers and cables sold by Canon sales representative or local Canon dealer as replacement parts for internal components, may result in increased emissions or decreased immunity of the CR-2 Plus AF.
5. The CR-2 Plus AF should not be used adjacent to or stacked with other equipment and if adjacent or stacked use is necessary, the CR-2 Plus AF should be observed to verify normal operation in the configuration in which it will be used.
Guidance and Manufacturer's Declaration for Electromagnetic Emission

The CR-2 Plus AF is intended for use in the electromagnetic environment specified below. The customer or the user of the CR-2 Plus AF should assure that it is used in such an environment.

NOTE: $U_T$ is the a.c. mains voltage prior to application of the test level.
**Guidance and Manufacturer’s Declaration for Electromagnetic Immunity**

The CR-2 Plus AF is intended for use in the electromagnetic environment specified below. The customer or the user of the CR-2 Plus AF should assure that it is used in such an environment.

<table>
<thead>
<tr>
<th>Immunity Test</th>
<th>IEC 60601 Test Level</th>
<th>Compliance Level</th>
<th>Electromagnetic Environment – Guidance</th>
</tr>
</thead>
</table>
| Conducted RF  | EN IEC 61000-4-6      | 3 Vrms 150 kHz to 80 MHz | 3 Vrms | Portable and mobile RF communications equipment should be used no closer to any part of the CR-2 Plus AF, including cables, than the recommended separation distance calculated from the equation applicable to the frequency of the transmitter. Recommended Separation Distances: \( d = 1.2 \sqrt{P} \) 80 MHz to 800 MHz, \( d = 2.3 \sqrt{P} \) 800 MHz to 2.5 GHz. Where \( P \) is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and \( d \) is the recommended separation distance in metres (m). Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey\(^a\), should be less than the compliance level in each frequency range\(^b\). Interference may occur in the vicinity of equipment marked with the following symbol: ![Signal Symbol](image)
| Radiated RF   | EN IEC 61000-4-3      | 3 V/m 80 MHz to 2.5 GHz | 3 V/m |

NOTE 1: At 80 MHz and 800 MHz, the higher frequency range applies.

NOTE 2: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

\( a \) Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered.

If the measured field strength in the location in which the CR-2 Plus AF is used exceeds the applicable RF compliance level above, the CR-2 Plus AF should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as reorienting or relocating the CR-2 Plus AF.

\( b \) Over the frequency range 150 kHz to 80 MHz, field strengths should be less than 3 V/m.
Recommended Separation Distances between Portable and Mobile RF Communications Equipment and Devices or the CR-2 Plus AF

The CR-2 Plus AF is intended for use in an electromagnetic environment in which radiated RF disturbances are controlled. The customer or the user of the CR-2 Plus AF can help prevent electromagnetic interference by maintaining a minimum distance between portable and mobile RF communications equipment (transmitters) and the CR-2 Plus AF as recommended below, according to the maximum output power of the communications equipment.

<table>
<thead>
<tr>
<th>Rated maximum output power of transmitter W</th>
<th>Separation distance according to frequency of transmitter m</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>150 kHz to 80 MHz d = 1.2 √P</td>
</tr>
<tr>
<td></td>
<td>80 MHz to 800 MHz d = 1.2 √P</td>
</tr>
<tr>
<td></td>
<td>800 MHz to 2.5 GHz d = 2.3 √P</td>
</tr>
<tr>
<td>0.01</td>
<td>0.12</td>
</tr>
<tr>
<td>0.1</td>
<td>0.38</td>
</tr>
<tr>
<td>1</td>
<td>1.2</td>
</tr>
<tr>
<td>10</td>
<td>3.8</td>
</tr>
<tr>
<td>100</td>
<td>12</td>
</tr>
</tbody>
</table>

For transmitters rated at a maximum output power not listed above, the recommended separation distance d in metres (m) can be estimated using the equation applicable to the frequency of the transmitter, where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.

NOTE 1: At 80 MHz and 800 MHz, the separation distance for the higher frequency range applies.

NOTE 2: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.
Warranty and Repair Service

Service life
The service life of this product is eight years if specified inspections and maintenance are performed.

About repairs
If a problem cannot be solved even after taking the measures indicated in “7 Troubleshooting” (see page 43), contact your sales representative or local Canon dealer for repairs.

When requesting repair, please provide us with the following information.

Name of the instrument: CR-2 Plus AF
Serial number: 6-digit number on the rating label
Description of malfunction: Report as much detail as possible.

Time limit for supplying performance parts for repair
Performance parts (parts for repairs to maintain performance) will be stocked for eight years after production of the CR-2 Plus AF is discontinued.

Expendable parts replaced by service personnel
The following parts are consumable or may deteriorate because of characteristics of their material or construction.

These parts cannot be replaced by the user. If these parts are found to be worn out or to have deteriorated during daily or regular inspection, contact your sales representative or local Canon dealer for repairs.

- Baseboard (USB connector)
- Xenon lamp
